## Dear Customer

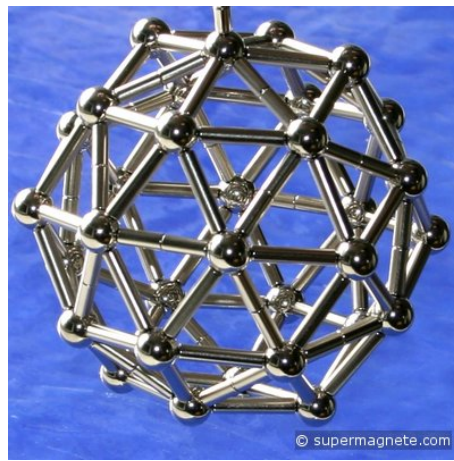

We offer you the strongest magnets in many shapes and sizes. Nearly all of our magnets are made of Neodymium Iron Boron (NdFeB). These are the strongest permanent magnets in existence. They are many times stronger than typical magnets.

You have to experience these magnets yourself in order to understand why they are called "SuperMagnets".

This catalogue displays the same articles that are available in our webshop. You can find more detailed information and additional photos in the item descriptions at [www.supermagnete.de](http://www.supermagnete.de). We have made every effort to simplify the order process for you.

We hope you enjoy your shopping experience!

Matthias Ackermann and Reto Heygel

## **Terms of Delivery (Germany)**

Delivery Conditions of other countries: <http://www.supermagnete.de/eng/conditions.php?c=other>

### **Shipping Costs**

There is a flat rate for shipping and handling of **EUR 5,50**. (For custom-made orders or large quantities different shipping and handling charges may be negotiated.) The insured package will be sent from Gottmadingen (Germany) via DHL.

### **VAT**

All shop prices include German VAT of 19%.

### **Delivery time**

Shipment typically occurs one business day after the order (respectively the payment) is received.

Delivery time is between 2 and 4 business days within Germany and from 2 to 10 working days into the remaining EU.

### **Payment**

#### **• Pre-payment to our account in Germany**

We will send you our account details via e-mail with the order confirmation. As soon as we receive your payment, we will ship you the merchandise.

#### **• Invoice**

We will send you an invoice with the shipment. The net invoice amount is payable within 30 days without deductions. We deliver on account only to public institutions (schools, museums, universities, ...), public authorities and well known companies. We reserve the right to request pre-payment from companies unknown to us or for very large orders.

#### **• Credit card (Master Card, VISA, American Express)**

Payment will be completed at the end of the order over a secure connection.

#### **• sofortbanking**

sofortbanking is the TÜV-certified online payment system of Payment Network AG. In cooperation with the Sofort Bank you get buyers protection in case of non-delivery. For payment with sofortbanking you need an online banking account, your PIN and TAN.

#### **• PayPal**

Payment will be completed at the end of the order over a secure connection.

### **Minimum order**

The minimum order amount is EUR 15,00 (including VAT, not including shipping costs). For orders under EUR 15,00 we charge a small quantity surcharge [[http://www.supermagnete.de/eng/faq/extra\\_amount](http://www.supermagnete.de/eng/faq/extra_amount)] of EUR 7,00 (or the difference to the minimum order value).

### Countersunk pot magnets:

Distinctive feature: These magnets can be fastened with a countersunk screw.

Principle: The magnets are embedded in a steel pot. The steel pot increases the adhesive force of the magnet on direct contact with a thick iron surface. If there is no direct contact with the counterpart, or if the steel plate is thin, painted or rough, you can strain it much less.

Shear force: The indicated adhesive force was measured perpendicular to the surface to which the magnet should stick. It takes a lot less strength to move the magnet sideways. Therefore, you can strain a pot magnet much less if you use it on a wall as opposed to using it on the ceiling.

Rust: These magnets are not rust-free and therefore intended for dry indoor use.

## Pot magnets with hook:

Distinctive feature: These magnets can be used to hang up objects.  
You can unscrew the hook.

Principle: The magnets are embedded in a steel pot. The steel pot increases the adhesive force of the magnet on direct contact with a thick iron surface. If there is no direct contact with the counterpart, or if the steel plate is thin, painted or rough, you can strain it much less.

Shear force: The indicated adhesive force was measured perpendicular to the surface to which the magnet should stick. It takes a lot less strength to move the magnet sideways. Therefore, you can strain a pot magnet much less if you use it on a wall as opposed to using it on the ceiling.

Rust: These magnets are not rust-free and therefore intended for dry indoor use.

When you insert the pen (included) into the penholder, a small Supermagnet is pressed into the shaft towards the ferrofluid, which then flows towards the magnet, creating a thorny half-sphere around the magnet. Fascinating!</p>

## Questions About Our Webshop

### Do you deliver on account?

We deliver on account to

- public institutions (schools, museums, universities, ...)
- public authorities
- well known companies

We reserve the right to request pre-payment from companies unknown to us or for very large orders. (See our terms of delivery [<http://www.supermagnete.de/eng/conditions.php?highlight=payment>].)

### Do you deliver COD (cash on delivery)?

Due to the high costs involved in COD, we do not offer this method of payment at present.

### Can I buy super magnets in stores?

No, we do not maintain any shops. We distribute our magnets exclusively through our webshop.

### Can I pick up my super magnets myself?

We have only a few magnet samples in our offices in Uster and our warehouse is managed by an external logistics company. Therefore, it is not possible for you to personally pick up your order.

## Questions About Our Assortment

### I can't find my desired magnet size in your webshop. Do you deliver custom-made magnets?

Yes, we would be pleased to send you an offer for a custom made magnet. Simply enter the desired specifications in the request form [[http://www.supermagnete.de/eng/custom\\_form.php](http://www.supermagnete.de/eng/custom_form.php)]. Please note: Custom orders must be paid in advance and, after payment is received, the delivery time will be approx. 4-8 weeks.

### How are the magnets magnetised? Where are the poles?

Practically all of our magnets are magnetised **parallel to the shortest side**. There are a few exceptions, which are specially noted in the article descriptions.

This means: For **blocks**, the poles are normally on the largest surface areas.

For **rods** and **discs**, the poles are on the circular surface area. This is also called "axial" magnetisation.

The **rings** are - unless otherwise noted - also axially magnetised.

The poles lie on 2 opposite surface areas of the **cubes**.

Likewise, the **spheres** have 2 opposite poles, much like the globe.

A few of our round magnets are **diametrically** magnetised:

- S-06-2.5-DHN [<http://www.supermagnete.de/eng/S-06-2.5-DHN>]
- S-10-05-DN [<http://www.supermagnete.de/eng/S-10-05-DN>]
- S-12-06-DN [<http://www.supermagnete.de/eng/S-12-06-DN>]
- S-04-10-N [<http://www.supermagnete.de/eng/S-04-10-N>]
- R-10-05-05-DN [<http://www.supermagnete.de/eng/R-10-05-05-DN>]
- R-10-07-03-N [<http://www.supermagnete.de/eng/R-10-07-03-N>]

The following block magnets are magnetised **lengthwise**:

- Q-19-13-06-LN [<http://www.supermagnete.de/eng/Q-19-13-06-LN>]
- Q-50-25-10-LN [<http://www.supermagnete.de/eng/Q-50-25-10-LN>]

### Could you advise me on my magnet application?

Possibly - try us! We can probably help you with certain questions. It's best if you contact us via e-mail with a description of your planned use of the magnets. Our strengths definitely lie in the procurement, sales and distribution of low-priced neodymium magnets and efficient logistics, and less in the development of magnet systems. If we are not sure that we can handle your question with the required amount of competence, we will certainly let you know.

## Questions about neodymium super magnets

### What do the specifications N40, N42, N45, etc. mean?

**The specifications N40, N42, N45, N45H etc. is a measurement for the quality of the magnet material. You can read two things from this:**

- How much **"magnet energy"** per volume is contained in this magnetic material
- Up to what **temperature** the magnet can be used

The **numbers** (e.g., 40, 42, 45) are equivalent to approximately the maximum energy product [[http://www.supermagnete.de/eng/faq/energy\\_product](http://www.supermagnete.de/eng/faq/energy_product)] of the magnet (in MGOe).

The **letters** N, M, H, SH, UH or EH say something about the maximum working temperature, which can be 80, 100, 120, 150, 180 or 200 °C. Most of our magnets begin with an "N" and should be used at 80 °C. You can find more detailed information under our FAQ What is the maximum temperature for super magnets? [<http://www.supermagnete.de/eng/faq/temperature>].

When we speak colloquially about the **"power"** of a magnet, we usually mean either the adhesive force on direct contact with a metal plate or the attractive force to a piece of iron (or another magnet) at a certain distance.

The power is not only determined by the magnetic material used; equally important are the following factors:

- Volume of the magnet
- Form of the magnet
- Proportions of the magnet (e.g. the ratio of the diameter to the height of a disc magnet)
- Combination with other materials, e.g. is the magnet mounted on a piece of metal, in a metal pot, or is it "free-standing".

This is similarly true in relationship to the working temperature. The specified maximum temperature can only be used without a problem when the aspect ratio of the magnet is "ideal". If a magnet is, for example, very thin in relation to its diameter (or side length), the maximum temperature is reached earlier.

If you take any two magnets of different sizes and magnetisation from our collection, the difference in their strength is more due to the differences in their volume than the differences in their magnetisation. That's why the larger magnet is mostly the stronger magnet, even when its magnetisation classification is somewhat smaller.

You can find the exact associations between these classifications and the physical values of a magnet in the table Physical magnet data [[http://www.supermagnete.de/eng/data\\_table.php](http://www.supermagnete.de/eng/data_table.php)].

### How strong is this magnet?

As an indication we add to the description of some magnets the approximate adhesive force in grams or kilograms. However, this is only a theoretical maximum value, which can only be obtained under ideal conditions. The actual adhesive force depends on the following factors:

- **Distance between magnet and object:**

If there is no direct contact between the magnet and the object, the adhesive force decreases quickly with increasing distance. Even a small gap of half a millimetre could cut the adhesive force in half.

Also, a thin paint cover on the object contributes to a decrease in adhesive force as well.

- **Material of object of magnetic attraction:**

The theoretical adhesive force is valid when the object of magnetic attraction consists of pure soft iron. This value is reduced by about 5% when it comes to structural steel ST37 and approx. 30% with ST70.

- **Surface area of the object of magnetic attraction:**

The smoother the surface, the greater the adhesive force. For rougher surfaces, you should anticipate a considerable reduction in adhesive force.

- **Direction of the force:**

The theoretical adhesive force is valid if a vertical force applies, that is, if the object of magnetic attraction is pulled vertically by the magnet. See our FAQ about shear force [<http://www.supermagnete.de/eng/faq/force2>]

- **Thickness of the object of magnetic attraction:**

The object should not be too thin or a magnetic saturation will be achieved and part of the magnetic field will remain useless.

In principle, when planning a specific application you should not rely on our adhesive force specifications, but rather do an experiment of your own first.

By the way: If you require the adhesive force in Newton, multiply our specifications in kg by 9,81 (a mass of 1 kg creates a downward force of 9,81 Newton).

### Where are super magnets manufactured?

Our magnets are produced in China. About 140 Chinese manufacturers produce the majority of all neodymium magnets worldwide. We evaluated at least a dozen different manufacturers and checked the price/benefit-relationship. Our current supplier delivers magnets of constant quality at very reasonable prices. And since we purchase magnets in large amounts and have automated nearly 100% of the order process, we are fairly certain that, with us, you will find the very best price/benefit-relationship.

### What kind of adhesives can I use for magnets?

We recommend **UHU plus endfest 300** for most applications. Therefore, we offer this article in our online shop. You can find additional information under article description [<http://www.supermagnete.de/eng/M-15>].

### Do magnets weaken over time?

Under normal conditions, neodymium magnets retain their magnetism nearly indefinitely. They differ in this case from conventional ferrite magnets that lose their magnetism over time, even without outside influences.

Influences that can lead to a loss of magnetic strength in neodymium magnets include:

- heat: most of our magnets should be exposed to a maximum of 80° C
- other strong magnetic fields

## Customer Testimonials

**Thanks for the magnets. Thanks especially for the extra magnets. When I was opening the package, first I was detaching S-20-10-N discs from their own package and immediately I got 2 of those magnets stuck to together and I had hard time detaching them. Later i detached those with a flat knife.**

K.H.H.

**Yesterday evening my flat mate got to know the "skin pincher" [Q-20-20-10-N] a bit closer. He yelped like a puppy dog.**

M.S.

**I am so surprised that an Internet order can be executed so painlessly and so fast these days that I just felt I needed to tell you. I wish you many more happy customers.**

F.K.

**The magnets are unbelievable, and of course I have already pinched my fingers (not for the first time ...)**

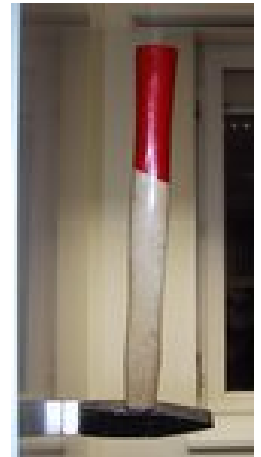

H.P.

**You guys are crazy! I haven't seen anything like that before.**

S.L.

**Having read the part of your warnings where it says "Don't say you haven't been warned" I let two Q-25-25-13 clash together yesterday while holding my finger between them. One would not believe how much that hurts!!**

J.S.
