Dear Customer

We offer you the strongest magnets in many shapes and sizes. Nearly all of our magnets are made of Neodymium Iron Boron (NdFeB). These are the strongest permanent magnets in existence. They are many times stronger than typical magnets.

You have to experience these magnets yourself in order to understand why they are called "super magnets".

This catalogue displays the same articles that are available in our web shop. You can find more detailed information and additional photos in the item descriptions at www.supermagnete.de. We have made every effort to simplify the order process for you.

I hope you enjoy your shopping experience!

Ring magnets neodymium

Most ring magnets have their north and south poles on the even circular surfaces (axial magnetisation). The few exceptions that are diametrically magnetised are especially marked.

Cone magnets neodymium

These neodymium magnets are cone-shaped. On the small circular area the magnetic field lines are bundled, which gives the magnets a very high adhesive force. They are perfectly suitable for whiteboards, magnetic boards, etc. The stump holds notes securely and it can be easily removed by pulling it off to the side. If the base is attached to a metal surface, however, it is hard to remove.

Water-proof neodymium magnets: rust-proof & with scratch protection

The neodymium magnets in this group are entirely coated by a layer of rubber, which provides the following advantages:

Scratch protection: Delicate surfaces, such as whiteboards or magnetic glass boards, are well protected

Waterproof: These magnets are rustproof and can be used outdoors as long as the rubber coating stays intact

Friction: The rubber coat substantially increases the magnetic adhesive force in shear direction

Due to the rubber coating the maximum adhesive force of these magnets is slightly lower, however, compared to similar-sized neodymium magnets without coating.

Countersunk pot magnets screw-on

Distinctive feature: These magnets can be fastened with a countersunk screw.

Principle: The magnets are embedded in a steel pot. The steel pot increases the adhesive force of the magnet on direct contact with a thick iron surface. If there is no direct contact with the counterpart, or if the steel plate is thin, painted or rough, you can strain it much less.

Shear force: The indicated adhesive force was measured perpendicular to the surface to which the magnet should stick. It takes a lot less strength to move the magnet sideways. Therefore, you can strain a pot magnet much less if you use it on a wall as opposed to using it on the ceiling.

Rust: These magnets are not rust-free and therefore intended for dry indoor use.

Pot magnets with threaded stem

Distinctive feature: These magnets have an external thread.

Principle: The magnets are embedded in a steel pot. The steel pot increases the adhesive force of the magnet on direct contact with a thick iron surface. If there is no direct contact with the counterpart, or if the steel plate is thin, painted or rough, you can strain it much less.

Shear force: The indicated adhesive force was measured perpendicular to the surface to which the magnet should stick. It takes a lot less strength to move the magnet sideways. Therefore, you can strain a pot magnet much less if you use it on a wall as opposed to using it on the ceiling.

Rust: These magnets are not rust-free and therefore intended for dry indoor use.

Eyelet magnets neodymium

Distinctive feature: These magnets are suitable for securely hanging up objects. The eyelet can be removed. You can choose between silver-coloured and white eyelet magnets. The latter are barely noticeable on white walls and ceilings. The silver eyelet magnets are slightly cheaper and stronger.

Principle: The magnets are embedded in a steel pot. The steel pot increases the adhesive force of the magnet on direct contact with a thick iron surface. If there is no direct contact with the counterpart, or if the steel plate is thin, painted or rough, you can strain it much less.

Shear force: The indicated adhesive force was measured perpendicular to the surface to which the magnet should stick. It takes a lot less strength to move the magnet sideways. Therefore, you can strain a pot magnet much less if you use it on a wall as opposed to using it on the ceiling.

Rust: These magnets are not rust-proof and therefore intended for dry indoor use.

Pot magnets with internal thread

Distinctive feature: These magnets have a metric internal thread and can be fastened with objects with an external thread.

Principle: The magnets are embedded in a steel pot. The steel pot increases the adhesive force of the magnet on direct contact with a thick iron surface. If there is no direct contact with the counterpart, or if the steel plate is thin, painted or rough, you can strain it much less.

Shear force: The indicated adhesive force was measured perpendicular to the surface to which the magnet should stick. It takes a lot less strength to move the magnet sideways. Therefore, you can strain a pot magnet much less if you use it on a wall as opposed to using it on the ceiling.

Rust: These magnets are not rust-proof and therefore intended for dry indoor use.

Pot magnets with rubber coat

Distinctive feature: These magnets have a metric internal screw thread and can be fastened with objects with an external screw thread. The rubber coat protects the sensitive surface from scratches and increases the load capacity in shear direction.

Principle: The magnets are embedded in a steel pot. The steel pot increases the adhesive force of the magnet on direct contact with a thick iron surface. If there is no direct contact with the counterpart, or if the steel plate is thin, painted or rough, you can strain it much less.

Shear force: The indicated adhesive force was measured perpendicular to the surface to which the magnet should stick. Despite the rubber coat, it takes less strength to move the magnet sideways. Therefore, you can strain a pot magnet much less if you use it on a wall as opposed to using it on the ceiling.

Rust: The rubber protects the magnet from occasional moisture and splashing water. Permanent outside use, however, can lead to rusting.

Pot magnets with screw socket

Distinctive feature: These pot magnets have a screw socket, into which you can screw hooks, eyelets, etc. We also carry identical hook magnets as well as eyelet magnets.

Principle: The strong neodymium magnets are embedded in a steel pot. The steel pot increases the adhesive force of the magnet on direct contact with a thick iron surface. If there is no direct contact with the counterpart, or if the steel plate is thin, painted or rough, you can strain it much less.

Shear force: The indicated adhesive force was measured perpendicular to the surface to which the magnet should stick. It takes a lot less strength to move the magnet sideways. Therefore, you can strain a pot magnet much less if you use it on a wall as opposed to using it on the ceiling.

Rust: These magnets are not rust-proof and therefore intended for dry indoor use.

Pot magnets & magnet systems with ferrite magnets

Distinctive feature: These magnets are ferrite and not neodymium magnets. They have therefore a lower adhesive force and are larger. But are cheaper than neodymium magnets and can be used outside as well.

Principle: The magnets are embedded in a steel pot. The steel pot increases the adhesive force of the magnet on direct contact with a thick iron surface. If there is no direct contact with the counterpart, or if the steel plate is thin, painted or rough, you can strain it much less.

Shear force: The indicated adhesive force was measured perpendicular to the surface to which the magnet should stick. It takes a lot less strength to move the magnet sideways. Therefore, you can strain a pot magnet much less if you use it on a wall as opposed to using it on the ceiling.

Rust: These magnets are rust-proof and can therefore be used outside and in wet surroundings as well. The pots surrounding the magnets, however, may develop surface rust over time.

Screw-on counterparts for magnets

These are no magnets! These metal discs are suitable as counterpart for our magnets, e.g. hook or block magnets with borehole.

They can be easily screwed onto non-magnetic surfaces with a countersunk bolt.

Questions About Our Web Shop

Can I buy super magnets in stores?

No, we do not maintain a physical store. We distribute our magnets exclusively through our web shop [<https://www.supermagnete.de/eng/>].

Can I pick up my ordered magnets directly?

We have only a few magnet samples in our offices and our warehouse is managed by an external logistics company. Therefore, it is not possible for you to personally pick up your order.

Do you deliver on account?

We deliver on account to

- Business customers
- Public institutions (schools, museums, universities, etc.)
- Government agencies

We reserve the right to request pre-payment from companies unknown to us or for very large orders.

(See our delivery terms [<https://www.supermagnete.de/eng/conditions.php?highlight=payment>])

Do you deliver COD (cash on delivery)?

Due to the high costs involved in COD, we do not offer this method of payment at present.

Questions about neodymium magnets (NdFeB)

What do the specifications N42, N45, N50, etc. mean?

The specifications N40, N42, N45, 35H etc. is a measurement for the quality of the magnet material. This tells you two things:

- How much "magnetic energy" per volume is contained in this magnet material
- Up to what temperature the magnet can be used

The **numbers** (e.g., 40, 42, 45) are equivalent to approximately the maximum energy product [<https://www.supermagnete.de/eng/faq/What-does-maximum-energy-product-mean>] of the magnet (in MGOe).

The **letters** N, M, H, SH, UH or EH say something about the maximum working temperature, which can be 80, 100, 120, 150, 180 or 200 °C. Most of our magnets begin with an "N" and can take temperatures of up to 80 °C. You can find more detailed information under our FAQ What temperatures can magnets sustain? [<https://www.supermagnete.de/eng/faq/What-temperatures-can-magnets-sustain>].

Magnetisation vs. SizeIf you take any two magnets of different sizes and magnetisation from our collection, the difference in their strength is more due to the differences in their volume than the differences in their magnetisation. That's why the larger magnet is mostly the stronger magnet, even when its magnetisation classification is somewhat smaller.

You can find the exact associations between these classifications and the physical values of a magnet in the table Physical magnet data [https://www.supermagnete.de/eng/data_table.php].

Buy strong neodymium magnets in our web shop

How strong is this magnet?

As an indication we add the approximate adhesive force in grams or kilograms to the description of our magnets. This is only a theoretical maximum value, which can only be obtained **under ideal conditions**. The actual adhesive force depends on the following factors:

a) Distance between magnet and adhesive surface

If there is no direct contact between the magnet and the object, the adhesive force decreases quickly with increasing distance. Even a small gap of half a millimetre could cut the adhesive force in half. Also, a thin paint cover on the object contributes to a decrease in adhesive force as well.

With our adhesive force tool you can determine the adhesive force at various distances.
Go to Adhesive Force Tool

b) Direction of the force: The theoretical adhesive force is valid if a vertical force applies, that is, if the object of magnetic attraction is pulled vertically by the magnet. See our FAQ about shear force [<https://www.supermagnete.de/eng/faq/Why-does-my-magnet-not-carry-the-maximum-weight-on-the-wall#pu601>] c) Material of the object of magnetic attraction: The theoretical adhesive force is valid when the object of magnetic attraction consists of pure soft iron. This value is reduced by about 5% when it comes to structural steel ST37 and approx. 30% with ST70.

d) Surface area of the object of magnetic attraction: The smoother the surface, the greater the adhesive force. For rougher surfaces, you should anticipate a considerable reduction in adhesive force.

e) Thickness of the object of magnetic attraction: The object should not be too thin or a magnetic saturation will be achieved and part of the magnetic field will remain useless.

Generally, you should never depend on our indications regarding adhesive force, but do your own test first.

By the way: If you need the adhesive force in Newton, multiply our specification in kg with 9,81 (A mass of 1 kg equals a weight of 9,81 Newton).

Does a magnet weaken over time?

Under normal circumstances, neodymium and ferrite magnets as well as magnetic tapes and sheets keep their magnetism practically indefinitely.

The following influences can lead to loss of magnetism:

Neodymium magnets [<https://www.supermagnete.de/eng/supermagnete-strong-neodymium-magnets>]

- Heat: Most neodymium magnets should not be exposed to temperatures exceeding 80 °C
- Strong jolts due to repeated blows
- Other strong magnetic fields (e.g. of electromagnets)

Ferrite magnets [<https://www.supermagnete.de/eng/ferrite-magnets>]

- Heat: Ferrite magnets shouldn't be exposed to temperatures above 250 °C
- Cold: Ferrite magnets shouldn't be cooled down below -40 °C
- Strong jolts due to repeated blows
- Other strong magnetic fields: Fields of electromagnets, but also neodymium magnets can demagnetise or reverse the polarity of ferrite magnets. Therefore, neodymium and ferrite magnets should always be stored and transported separately.

Magnetic tapes and magnetic sheets [<https://www.supermagnete.de/eng/magnetic-tape-magnetic-sheet-magnetic-strip>]

- Heat: Tapes and sheets cannot get hotter than 85 °C
- Cold: Tapes and sheets cannot get colder than -20 °C
- Strong jolts from repeated blows
- Other strong magnetic fields: Fields of electromagnets, but also neodymium and ferrite magnets can demagnetise or reverse the polarity of magnetic tapes and sheets. Therefore, they should always be stored and transported separately from other magnets.
